Santa Perpetua Mogoda, 20 November 2013

Dear Sirs

We certify that our products “Espiro PU Antiestático” and “Transliquid PU antiestático” are made with a rigid PVC spiral, covered by a flexible layer of polyurethane. Surrounding the spiral there is a conductive copper wire. This wire provides a minimum resistance path to the electrical charges that are generated during the utilization of plastic components in industrial environment, and therefore when this wire is connected to earth, these electrical charges are diverted to earth, avoiding its accumulation on the tube surface, which give these tube anti-static capabilities.

I remain at your disposal for further questions or comments

Yours faithfully

Javier Narváez

Quality Manager.
