Santa Perpetua Mogoda, 13 May 2014

Dear Sirs

We certificate that our product "Transliquid antistatic PU" is made from co-extrusion of a rigid PVC spiral covered by a flexible polyurethane layer. Besides, a copper wire is embedded in the flexible polyurethane layer which provides this tube with anti-static properties, as long as the two extremes of the copper wire are connected to a metallic surface at ground potential.

Yours faithfully

Javier Narváez

Quality Manager
